

YANNE CAPITAL

Lead Intelligence Platform

A simple, fast home for every lead — where you can search, filter, import, and finally see which campaigns, industries, and inbox providers are actually working.

Built on **Supabase** · **PostgreSQL**

2.4M+ records

Sub-second search

Secure API access

Hourly auto-sync

A plain-language guide

What it is · how it works · what you can do

Prepared for

Outreach Operations

June 2026

Version 1.0

11	How we'll build it	Step by step
12	In summary	The bottom line

A guide for the Yanne Capital team — written to be read by anyone, no technical background needed.

01 Welcome — what this platform is

Think of this platform as your own private, lightning-fast library of every lead your business has ever touched. Today those leads live inside your email tool, EmailBison, where they are slow to look through and hard to make sense of. This platform brings a complete copy of them into one tidy place that *you* own — and makes them instantly searchable, sortable, and easy to understand.

Once it's in place, anyone on the team will be able to open a single screen and answer questions that are almost impossible to answer today, such as:

- “Show me every lead in the **software** industry that we have **never emailed**.”
- “Which of our campaigns brought in the most interested replies?”
- “Did our **Google** inboxes get better responses than our **Outlook** ones?”
- “Which leads haven't been contacted in over 60 days?”

You'll also be able to add new leads yourself — one at a time, in bulk, or by importing a spreadsheet — and pull any slice of your data back out whenever you need it.

In one sentence: it's a fast, friendly home for all your leads, with powerful search, easy importing, and clear reports that tell you what's working and what isn't.

The four things it does for you

Keeps everything in one place

A complete, always-fresh copy of all your leads — searchable in an instant instead of page by page.

Makes adding leads easy

Add a single lead, paste in many at once, or import a spreadsheet — with no duplicates and no fuss.

Lets you find any group

Filter by industry, company, provider, “never contacted,” and dozens more — then export the list.

Shows you what works

Clear reports on your best campaigns, industries, and inbox providers — refreshed automatically.

02 Why we're building it

Right now, all of your leads — more than **2.4 million** of them — sit inside EmailBison. EmailBison is excellent at *sending* emails, but it was never designed to be a place where you browse, slice, and study your leads. That creates a few real, day-to-day problems.

The problems today

What you run into	Why it happens
It's painfully slow to look through	EmailBison only shows leads 15 at a time . To look through everything you'd have to click through more than 160,000 pages — which simply isn't practical.
You can't easily ask "what's missing"	There's no simple way to ask "who have we never emailed?" or "which industries are we ignoring?" — yet those are exactly the leads worth chasing.
It's hard to compare performance	You name campaigns by industry and provider, but there's no single view that lines them up side by side to show which performed best.
The data lives in one tool	Everything depends on EmailBison being fast and available. You don't have your own clean copy to work with, report on, or build on top of.

What changes once this is in place

The platform quietly keeps its own up-to-date copy of all your leads. Because that copy lives in a place built for searching, the same questions that are impossible today become instant — and the whole team works from one reliable source of truth.

The headline: no more clicking through endless pages, no more guesswork about what you've missed, and a clear, always-current picture of what's actually working.

03 How it works, simply

You don't need to understand anything technical to use the platform. But it helps to picture the simple idea behind it, because it explains why everything feels so fast.

The simple idea

Imagine EmailBison is a huge warehouse full of leads, but with only one narrow doorway — you can only carry out 15 boxes at a time. Searching the whole warehouse through that doorway would take forever.

So instead, the platform keeps its **own neat, fully-organised copy** of everything in the warehouse, right next to your desk. Whenever you search, filter, or build a report, you're looking at that tidy copy — which is why results appear instantly. EmailBison is only ever visited quietly in the background to keep the copy current. You never have to wait on that narrow doorway again.

The flow, at a glance

What the platform organises for you

As it copies each lead, the platform quietly tidies the information so it's actually useful. For example:

- It reads the **industry** attached to each lead and makes it something you can filter and group by.
- It notices which **inbox provider** a lead belongs to — Google, Outlook, Zoho and others — so you can compare them.
- It works out whether a lead has **ever been emailed**, and if so, **when they were last contacted**.
- It reads your **campaign names** (like “SaaS · Google · US”) and pulls out the industry, provider and region automatically.

Everything above happens automatically in the background. You just open the screen and everything is already sorted, labelled, and ready to use.

UNDER THE HOOD The tidy copy lives in a managed **PostgreSQL** database (hosted on Supabase) — the same battle-tested technology trusted by banks and large enterprises. Each detail the platform extracts is stored in its

own indexed field, which is what lets searches return in a fraction of a second even across millions of leads.

04 How your data stays up to date

A copy is only useful if it's current. The platform keeps itself fresh on its own, so you never have to press a “sync” button or worry about looking at stale numbers.

Three ways it stays current

1

The first big copy (once)

When we first switch it on, the platform carefully copies across all 2.4 million existing leads. This happens once, in the background, and is designed so that even if it's interrupted it simply picks up where it left off.

2

Hourly top-ups (always on)

Every hour, the platform checks EmailBison for anything that changed — new leads, new replies, new results — and updates only those. Because it only fetches what's changed, it's quick and gentle, and your view is never more than an hour behind.

3

Instant alerts for key moments (optional)

For important live events — like a lead replying or showing interest — EmailBison can notify the platform the moment it happens, so the most valuable updates appear almost immediately rather than waiting for the next hourly check.

What this means for you: open the platform any time and trust that what you're seeing is current — campaign results, reply counts, and “who's been contacted” are all kept fresh for you, automatically.

05 Adding leads

You're not limited to the leads already in EmailBison — you can add your own at any time. There are three easy ways to do it, depending on how many leads you have.

One at a time

Fill in a short form — name, email, company, and any details you have — and save. Perfect for adding a single contact you just met.

Many at once

Have a batch of leads ready? Add them all together in one go, rather than one by one.

Import a spreadsheet

Drag in a CSV file (the format every spreadsheet can save) and the platform brings in every row for you.

How importing a spreadsheet works, step by step

This is the option you'll likely use most, so here's exactly what happens:

1

Drag in your file

Drop your CSV onto the import screen. The platform reads the column headings straight away.

2

Match the columns

It shows you each column from your file and lets you confirm what it is — “this column is the email,” “this one is the company,” and so on. It guesses the obvious ones for you.

3

Choose what to do with duplicates

If a lead already exists, you decide: *update* their details, *fill in only the blanks*, or *skip* them entirely. No accidental duplicates.

4

Watch it import

A progress bar shows how it's going, and tells you clearly if any rows had problems (like a missing email) so you can fix them.

Every lead you add can optionally be sent up to EmailBison too, so the two stay in step — you add it once, and it's available everywhere.

06 Finding exactly the leads you want

This is where the platform really earns its keep. Instead of scrolling endlessly, you describe the group of leads you're after, and it shows you just those — in an instant, no matter how large your list.

The filters you'll have from day one

You can narrow your leads by any combination of these — mix and match as many as you like:

Who they are

Name · email · email's website (domain) · company · job title

What kind of lead

Industry · country · company size · inbox provider (Google, Outlook, Zoho...)

Where they stand

Never contacted · contacted but no reply · replied · marked interested

Timing

Added recently · not contacted in 30 / 60 / 90+ days · within a date range

Engagement

How many emails were sent · how many were opened · how many replied

Campaign & labels

Which campaign they belong to · any tags or labels on them

Filters that grow on their own

Here's a clever part: as EmailBison starts tracking new details about your leads — say, seniority or company revenue — those details **automatically become new filters**. You don't have to ask for them or wait for an update. The moment the information appears, you can filter by it.

Save the searches you use often

Found a useful group — like “software companies, on Outlook, never contacted”? Save it as a named list. From then on it's one click away, and its count updates itself as your data changes. These saved lists are a bit like smart folders that keep themselves current.

And when you've found your group, one button exports it to a spreadsheet — ready to hand off, upload, or use however you like.

UNDER THE HOOD

Results stay fast no matter how deep you scroll thanks to **cursor-based pagination** — instead of counting through millions of rows each time, the platform jumps straight to the next set. Exports are **streamed**, so even a list of hundreds of thousands of leads downloads smoothly without slowing anything down.

07 The questions you can finally answer

Beyond finding leads, the platform turns your data into clear answers. Each of the questions you most want to ask has its own simple report, kept up to date for you.

The question	What the platform shows you
How many leads have we never targeted?	A running count of leads that have never been emailed — and you can break it down by industry or provider to see where the untapped opportunity is.
Which leads have gone cold?	Everyone you haven't contacted in a chosen time window (say, 60+ days), ready to re-engage or export.
Which campaigns performed best?	A simple league table of campaigns, ranked by reply rate and interested replies — so your winners and duds are obvious at a glance.
Which industries are working?	Because you name campaigns by industry, the platform rolls results up by industry — showing which sectors reply and convert, and which to rethink.
Google or Outlook — which is better?	A side-by-side comparison of your inbox providers, showing which delivers and gets replies best (and the same for Zoho and others).
Which individual leads engaged?	For any lead, you can see exactly how they responded across the campaigns they were part of.

Why this matters: these reports turn a guessing game into a clear decision. You can confidently double down on the industries and providers that work, and stop spending effort on the ones that don't.

08 A tour of your dashboard

Everything comes together on one clean, easy-to-use screen. Here's what you'll find when you open it.

The leads table

A clear, scrollable list of your leads with a search box and filter buttons across the top. Click any lead to see their full story — details, campaigns, and replies.

Add & import

Buttons to add a single lead or import a spreadsheet, with the friendly step-by-step flow from Section 5.

Reports & charts

Visual dashboards for industries, providers, campaigns, and untapped leads — the answers from Section 7, shown as easy-to-read charts.

Export anything

Whatever you're looking at, a single button saves it to a spreadsheet.

Saved lists

Your saved searches, each with a live count, one click away.

Live highlights

A feed of the latest replies and newly-interested leads, so nothing slips by.

What using it feels like

You open the platform, type or click a couple of filters, and your exact group appears immediately. You glance at a chart to see how an industry is doing, export a list for the team, and import a fresh batch of leads from a spreadsheet — all from the same screen, all in a few clicks. No waiting, no spreadsheets full of copy-pasted exports, no clicking through endless pages.

The whole experience is built to feel quick and obvious. If you can use a typical web app, you can use this — there's nothing to learn.

09 Extra things you can do

On top of the essentials, the platform includes a handful of thoughtful extras that make it genuinely powerful in day-to-day work.

Smart lists that update themselves

Save any search — “SaaS · Outlook · never contacted” — and it keeps its own count current, so you always know how many opportunities are waiting.

Clean-up help

The platform flags duplicate or risky email addresses, so you don't waste sends on contacts that will bounce.

Opportunity map

A report that highlights the industries and providers with lots of leads you haven't contacted yet — pointing you straight to your best untapped audiences.

Send a group back to EmailBison

Found a great group? Push it straight into a new EmailBison campaign without leaving the platform.

Get pinged on interest

Have the platform message you (for example in Slack or by email) the moment a lead marks themselves interested.

Weekly summary email

A short, automatic digest of how your industries and providers performed that week, delivered to your inbox.

10 Technology & performance

You don't need to think about any of this to use the platform — but for peace of mind, here's a short, plain-English look at what it's built on and how it performs. The short version: modern, proven technology chosen for speed, security, and reliability at scale.

What it's built on

Part of the system	Technology	Why it was chosen
Where the data lives	Supabase (managed PostgreSQL)	One of the most trusted databases in the world, fully managed so it stays secure, backed up, and fast — comfortably handling millions of records.
The engine & API	Node.js & TypeScript	A fast, modern foundation for moving large amounts of data and serving requests reliably.
The dashboard	Next.js (modern web app)	A smooth, responsive interface that works in any browser, with no software to install.
Charts & reports	Interactive visual dashboards	Clear, clickable charts for industries, providers, and campaigns.

Performance & scale, at a glance

2.4M+ LEADS HANDLED WITH ROOM TO GROW	< 1 sec TYPICAL SEARCH & FILTER TIME	Hourly AUTOMATIC DATA REFRESH	24 / 7 ALWAYS AVAILABLE, HANDS-OFF
--	--	--	---

Built to be safe & dependable

 Secure by design Access is protected with private keys, and your secret EmailBison credentials are stored safely — never exposed in the app or to users.	 Backed up & recoverable The managed database is automatically backed up, so your data is protected against loss.
--	--

Self-healing updates

If an update is ever interrupted, it simply resumes where it left off — no missing or duplicated leads.

Ready to grow

The design scales smoothly as your lead count climbs, so it keeps performing as the business expands.

The takeaway: this is built on the same dependable, enterprise-grade foundations used by serious software companies — fast today, and ready for far more than 2.4 million leads tomorrow.

11 How we'll build it

We'll deliver the platform in clear stages, so you start getting value early rather than waiting for everything to be finished at once. Each stage builds on the last.

1

Set up the foundation

Create the secure home for your data and prepare it to receive all your leads.

2

Bring the data across & keep it fresh

Copy in all 2.4 million leads, then switch on the hourly updates so it stays current on its own.

3

Open up search, import & export

Turn on the ability to add, import, filter, and export leads — the core everyday tools.

4

Add the reports

Build the industry, provider, campaign, and untapped-leads insights.

5

Polish the dashboard

Wrap it all in the clean, friendly screen the team will use day to day.

6

Layer on the extras

Add the smart lists, alerts, push-back to EmailBison, and weekly summaries.

Good news: after the first three stages you already have the most important things — a complete, always-fresh copy of your leads that you can search, import, and export. The later stages make it even better.

12 In summary

The Lead Intelligence Platform takes all 2.4 million leads that are hard to reach inside EmailBison today and gives them a fast, friendly home you fully control.

What you walk away with

- A complete, always-up-to-date copy of every lead — searchable in an instant.
- Easy ways to add leads: one at a time, in batches, or by importing a spreadsheet.
- Powerful filters — including ones that appear on their own as new details arrive — plus saved lists and one-click export.
- Clear reports answering your real questions: who we've missed, which industries work, and Google versus Outlook.
- Helpful extras: opportunity maps, interest alerts, push-back to EmailBison, and weekly summaries.

The bottom line. No more clicking through endless pages, no more guessing what you've missed, and no more wondering what's working. You get one fast, clear place to see all your leads — and the confidence to focus your effort where it actually pays off.
